

## I. Final text (11.42)

**From: Dr. Merinstein**  
**To: Dr. Lisa Cuddy**  
**Subject: Patient Jessica**

--

**Dear Mrs. Dr. Lisa Cuddy,**

**as you know I will be on holiday for the next four weeks, therefore I would like to inform you about my Patient Jessica Boyde.**

**She presented with dizziness, passing out, and pain in her right leg. During the conversation it became clear that she does not eat very much (mostly she just drinks soda). Jessica Boyde is dieting and trying to lose weight while she is doing intensive sports regularly (cross country, 2h every day). Sometimes she throws up after binge eating and it came out that she has had amenorrhea for three months now. According to her own statement, she does not take laxatives or any other medication in order to lose weight.**

**When talking about her physical activity she mentioned the pain in her right knee, the pain can be treated with ice after the training and occurs after longer runs.**

**Her father came to the appointment with her, but I let him wait outside during the exam because I felt like Jessica would talk more without him in the room. Also, her father might be putting some pressure on her because he wants her to perform really well at sports, in fact he is also her coach. He does not know anything about her relationship to her boyfriend or her throwing up after eating a lot.**

**Furthermore I have started to talk to her about her sexual activities with her boyfriend and also a little bit about birth control. She hasn't been protecting herself adequately in the past, so it would be great if you could deal with that as well, communicating woman to woman.**

According to the patient, she and her friends do not take drugs or smoke, but some of her friends also purge after eating, which could be part of what causes her to do so as well.

**Suspected Diagnosis: *Bulimia nervosa***

- Binge eating
- Overexertion
- Loss of weight recently
- Amenorrhea for three months
- Fainting
- Irregular heartbeat

**Possible treatment and further procedure:**

- Dental check for loss of enamel etc. (due to throwing up and tongue piercing)
- Talk to her parents and friends about her recent weight loss
- Check her knee, possibly due to overexertion
- Run a blood analysis (check electrolyte and hormone status in order to partly confirm the suspected diagnosis)
- If the diagnosis is confirmed: psychiatric treatment should be considered

Thank you for taking over my patients during my vacation!

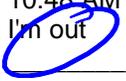

Yours sincerely,

Dr. Merinstein

11.40		<p>... Yours sincerely,  Dr. Merinstein</p>	
11.42		<p>From: Dr. Merinstein To: Dr. Lisa Cuddy Subject: Patient Jessica</p> <p>--</p> <p>Dear Mrs. Dr. Lisa Cuddy,</p> <p>as you know I will be on holiday for the next four weeks, therefore I would like to inform you about my Patient Jessica Boyde.</p> <p>She presented with dizziness, passing out, and pain in her right leg. During the conversation it became clear that she does not eat very much (mostly she just drinks soda). Jessica Boyde is dieting and trying to lose weight</p>	

		<p><b>while she is doing intensive sports regularly (cross country, 2h every day). Sometimes she throws up after binge eating and it came out that she has had amenorrhea for three months now. According to her own statement, she does not take laxatives or any other medication in order to lose weight.</b></p> <p><b>When talking about her physical activity she mentioned the pain in her right knee, the pain can be treated with ice after the training and occurs after longer runs.</b></p> <p><b>Her father came to the appointment with her, but I let him wait outside during the exam because I felt like Jessica would talk more without him in the room. Also, her father might be putting some pressure on her because he wants her to perform really well at sports, in fact he is also her coach. He does not know anything about her relationship to her boyfriend or her throwing up after eating a lot.</b></p> <p><b>Furthermore I have started to talk to her about her sexual activities with her boyfriend and also a little bit about birth control. She hasn't been protecting herself adequately in the past, so it would be great if you could deal with that as well, communicating woman to woman.</b></p> <p><b>According to the patient, she and her friends do not take drugs or smoke, but some of her friends also purge after eating, which could be part of what causes her to do so as well.</b></p>
